The tracking beam sweeps past a hovering drone: even at the best spot, the drone is above the criterion for about 8 seconds per pass

Wallops NEN WG1, 11.3 m, EESS 8160 MHz, Aqua, Terra, and Landsat 8 and 9 passes from November 1, 2026. One drone at 400 ft placed where the dish points at the moment of longest dwell; AirTag-measured EIRP for the left panel, the device at the limit for the pass table on the right.
