DRAFT//PRE-DECISIONAL

Most of the 93 dB gap at the NASA station is one step: from a drone placed perfectly in the beam to real traffic (55 dB)

Wallops NEN 11.3 m, EESS 8160 MHz. Each bar changes one assumption and keeps the earlier ones. The moving beam accounts for 18 dB and the 1% duty cycle for 20 dB. Decisions are measured from normal conditions. dB relative to the short-term allowance (0.005% of time).
