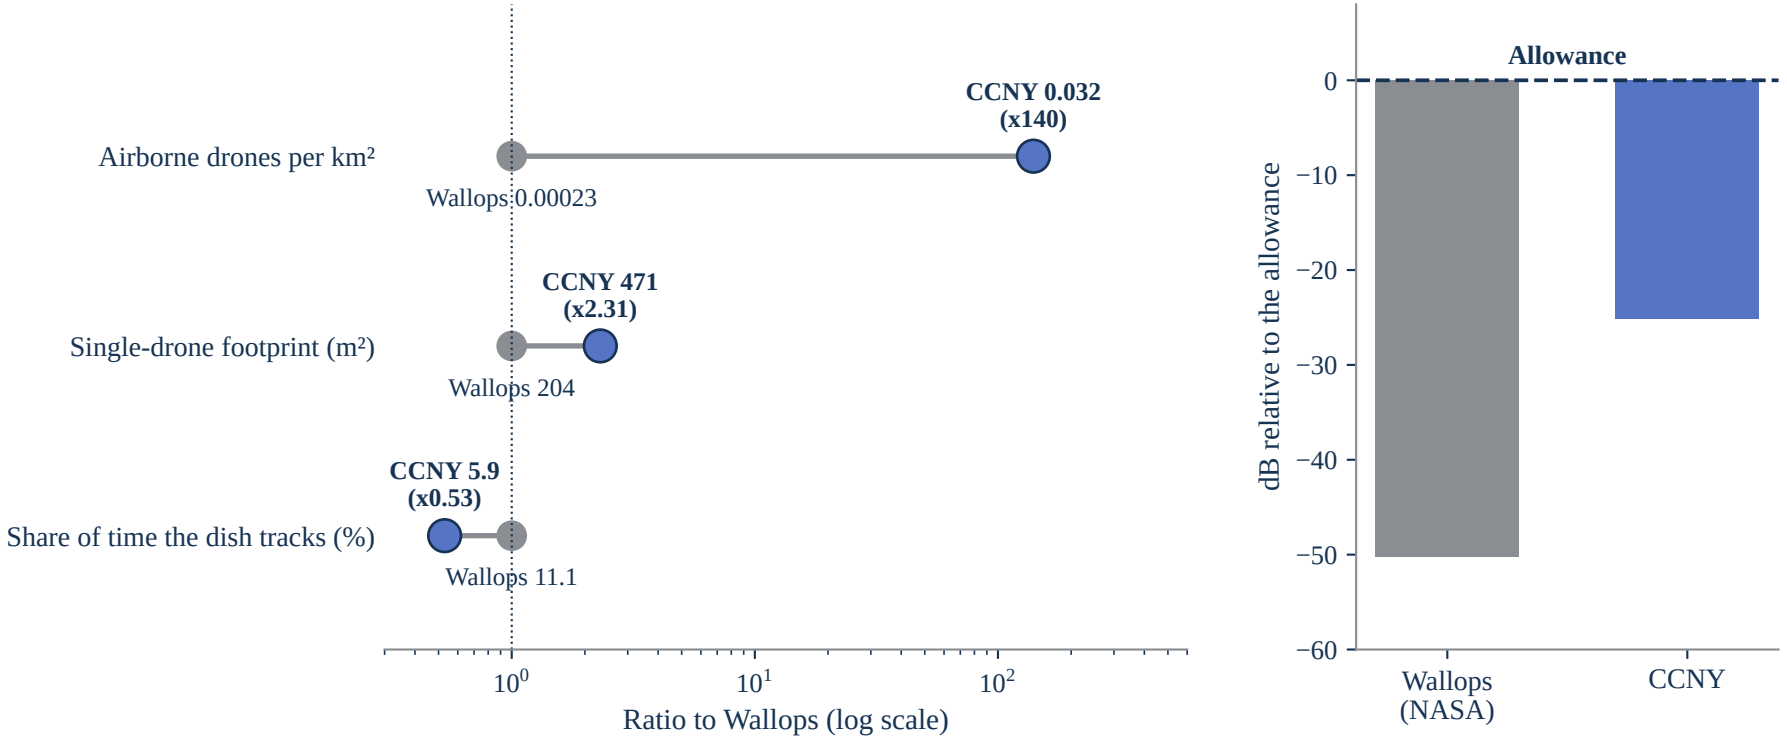
DRAFT//PRE-DECISIONAL

Manhattan sits 25 dB closer to the allowance than the NASA station, mostly because it has 140 times the drones

Normal conditions at the Wallops NEN station (11.3 m) and at CCNY in Manhattan (2.4 m; a university station, not a NASA facility). Left: the inputs that differ, each scaled to Wallops = 1 (log scale). Right: the result, dB relative to the short-term allowance.



Source: nicklasorte/7GHz_UWB_NRPM, example_bridge_rev1.m, run of November 11, 2026 (docs/bridge_results/bridge_summary.csv, run_log_bridge_rev1.txt). Density from FAA 2025 survey and Census data.
